

Goncalves fetal pancreas progenitor UMAPs and full TBS trees

Each row pairs one UMAP with the matching whole radial adaptive–diffusion TBS tree using the same coloring rule

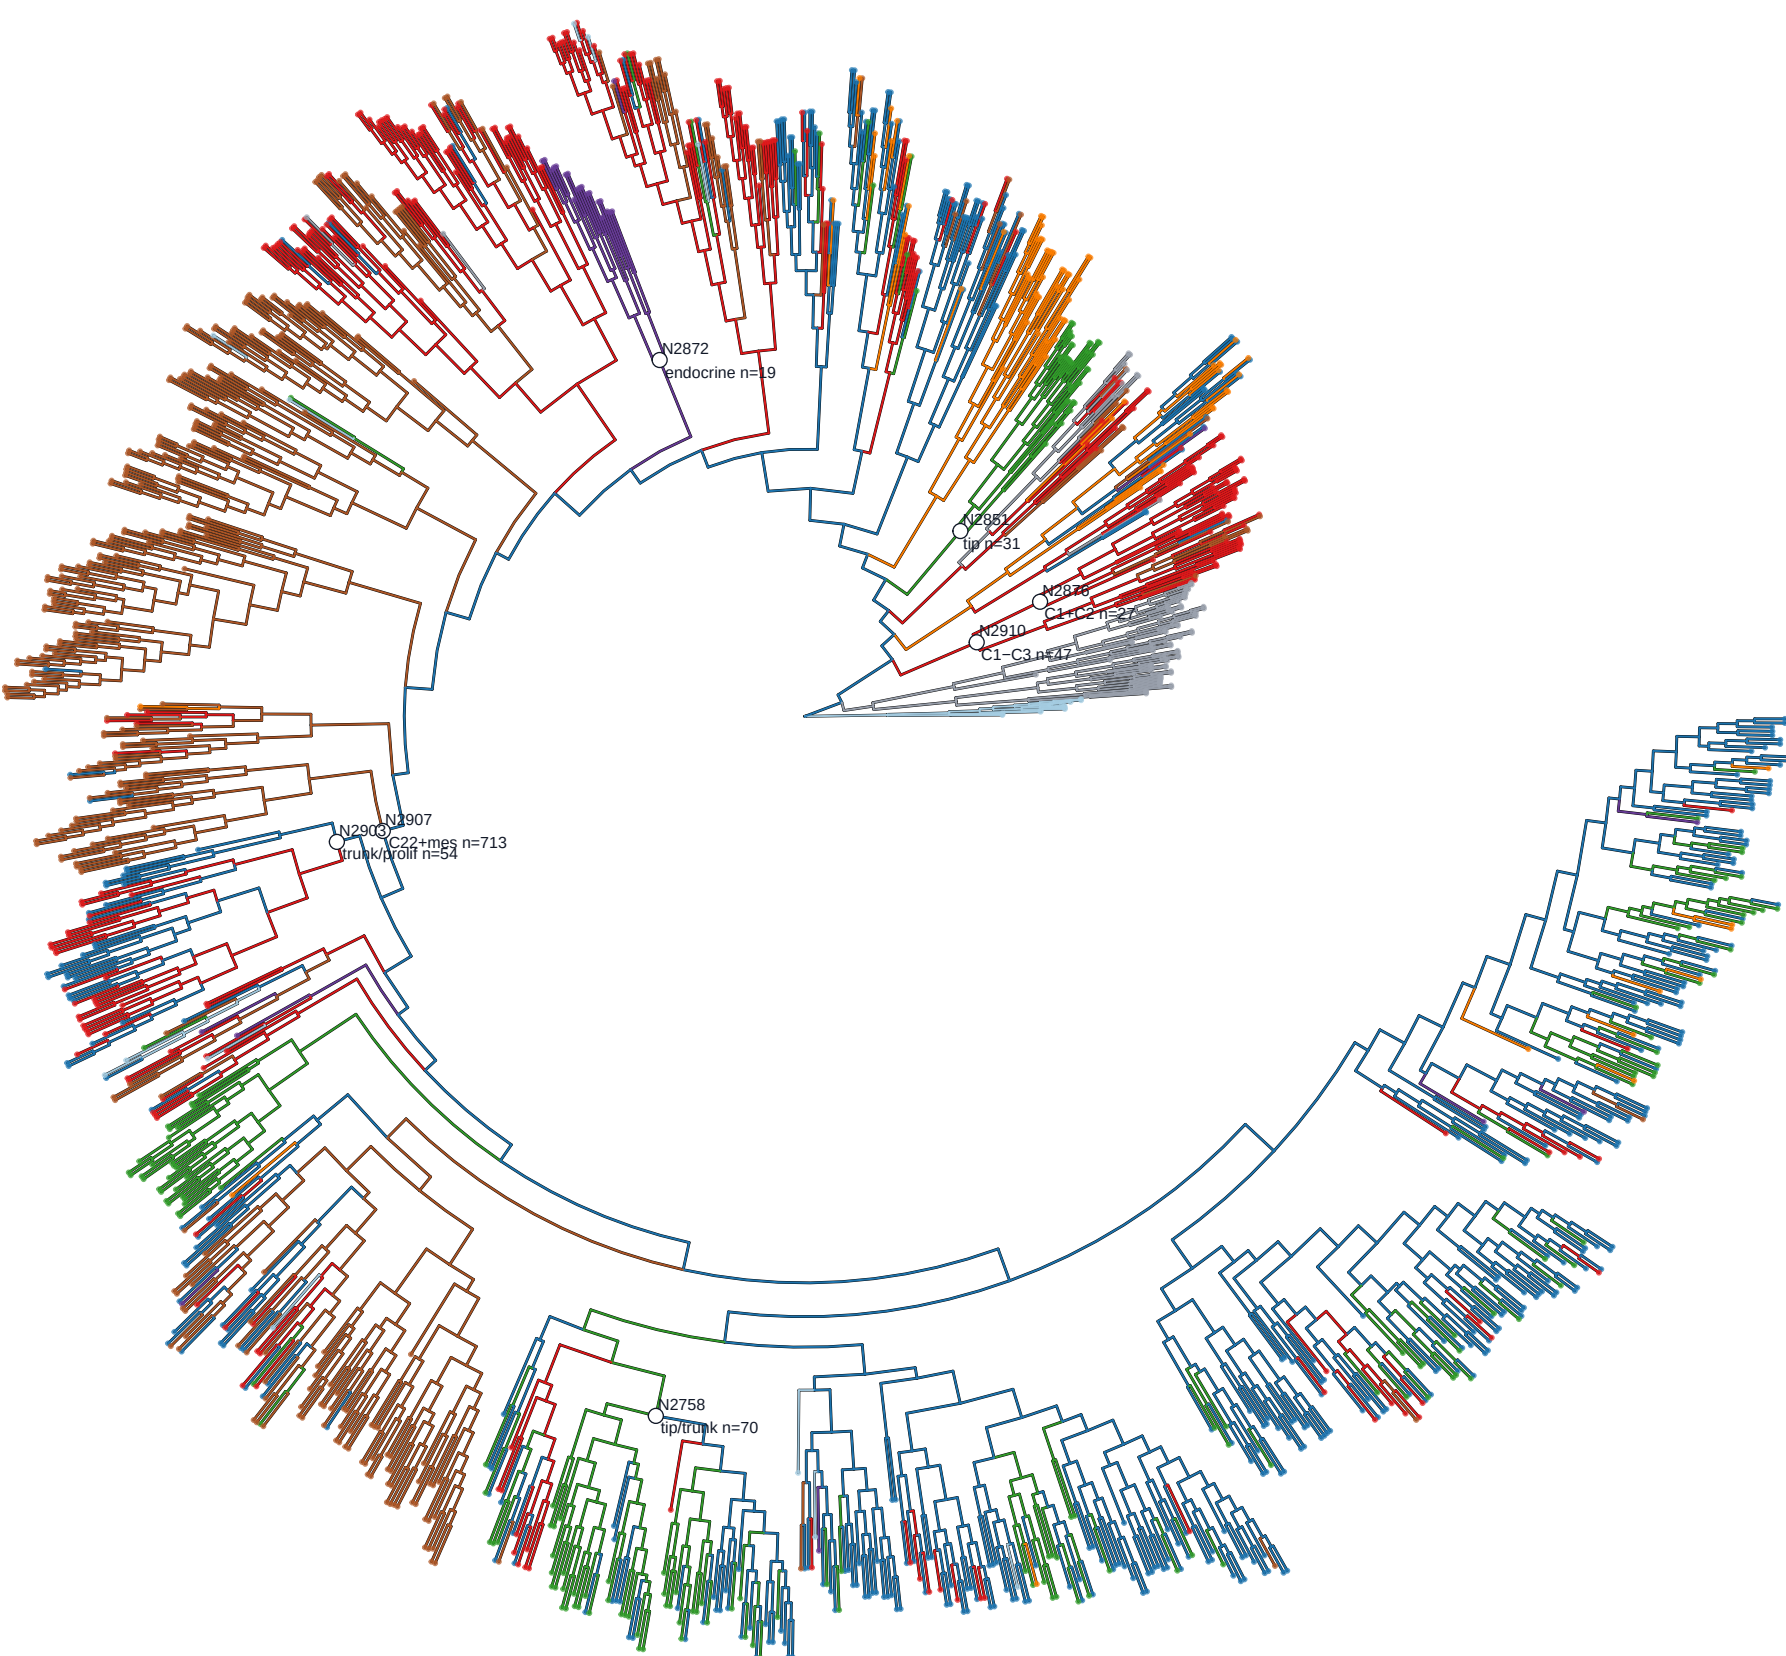

UMAP by fetal population

Same cell labels used for terminal tree tips

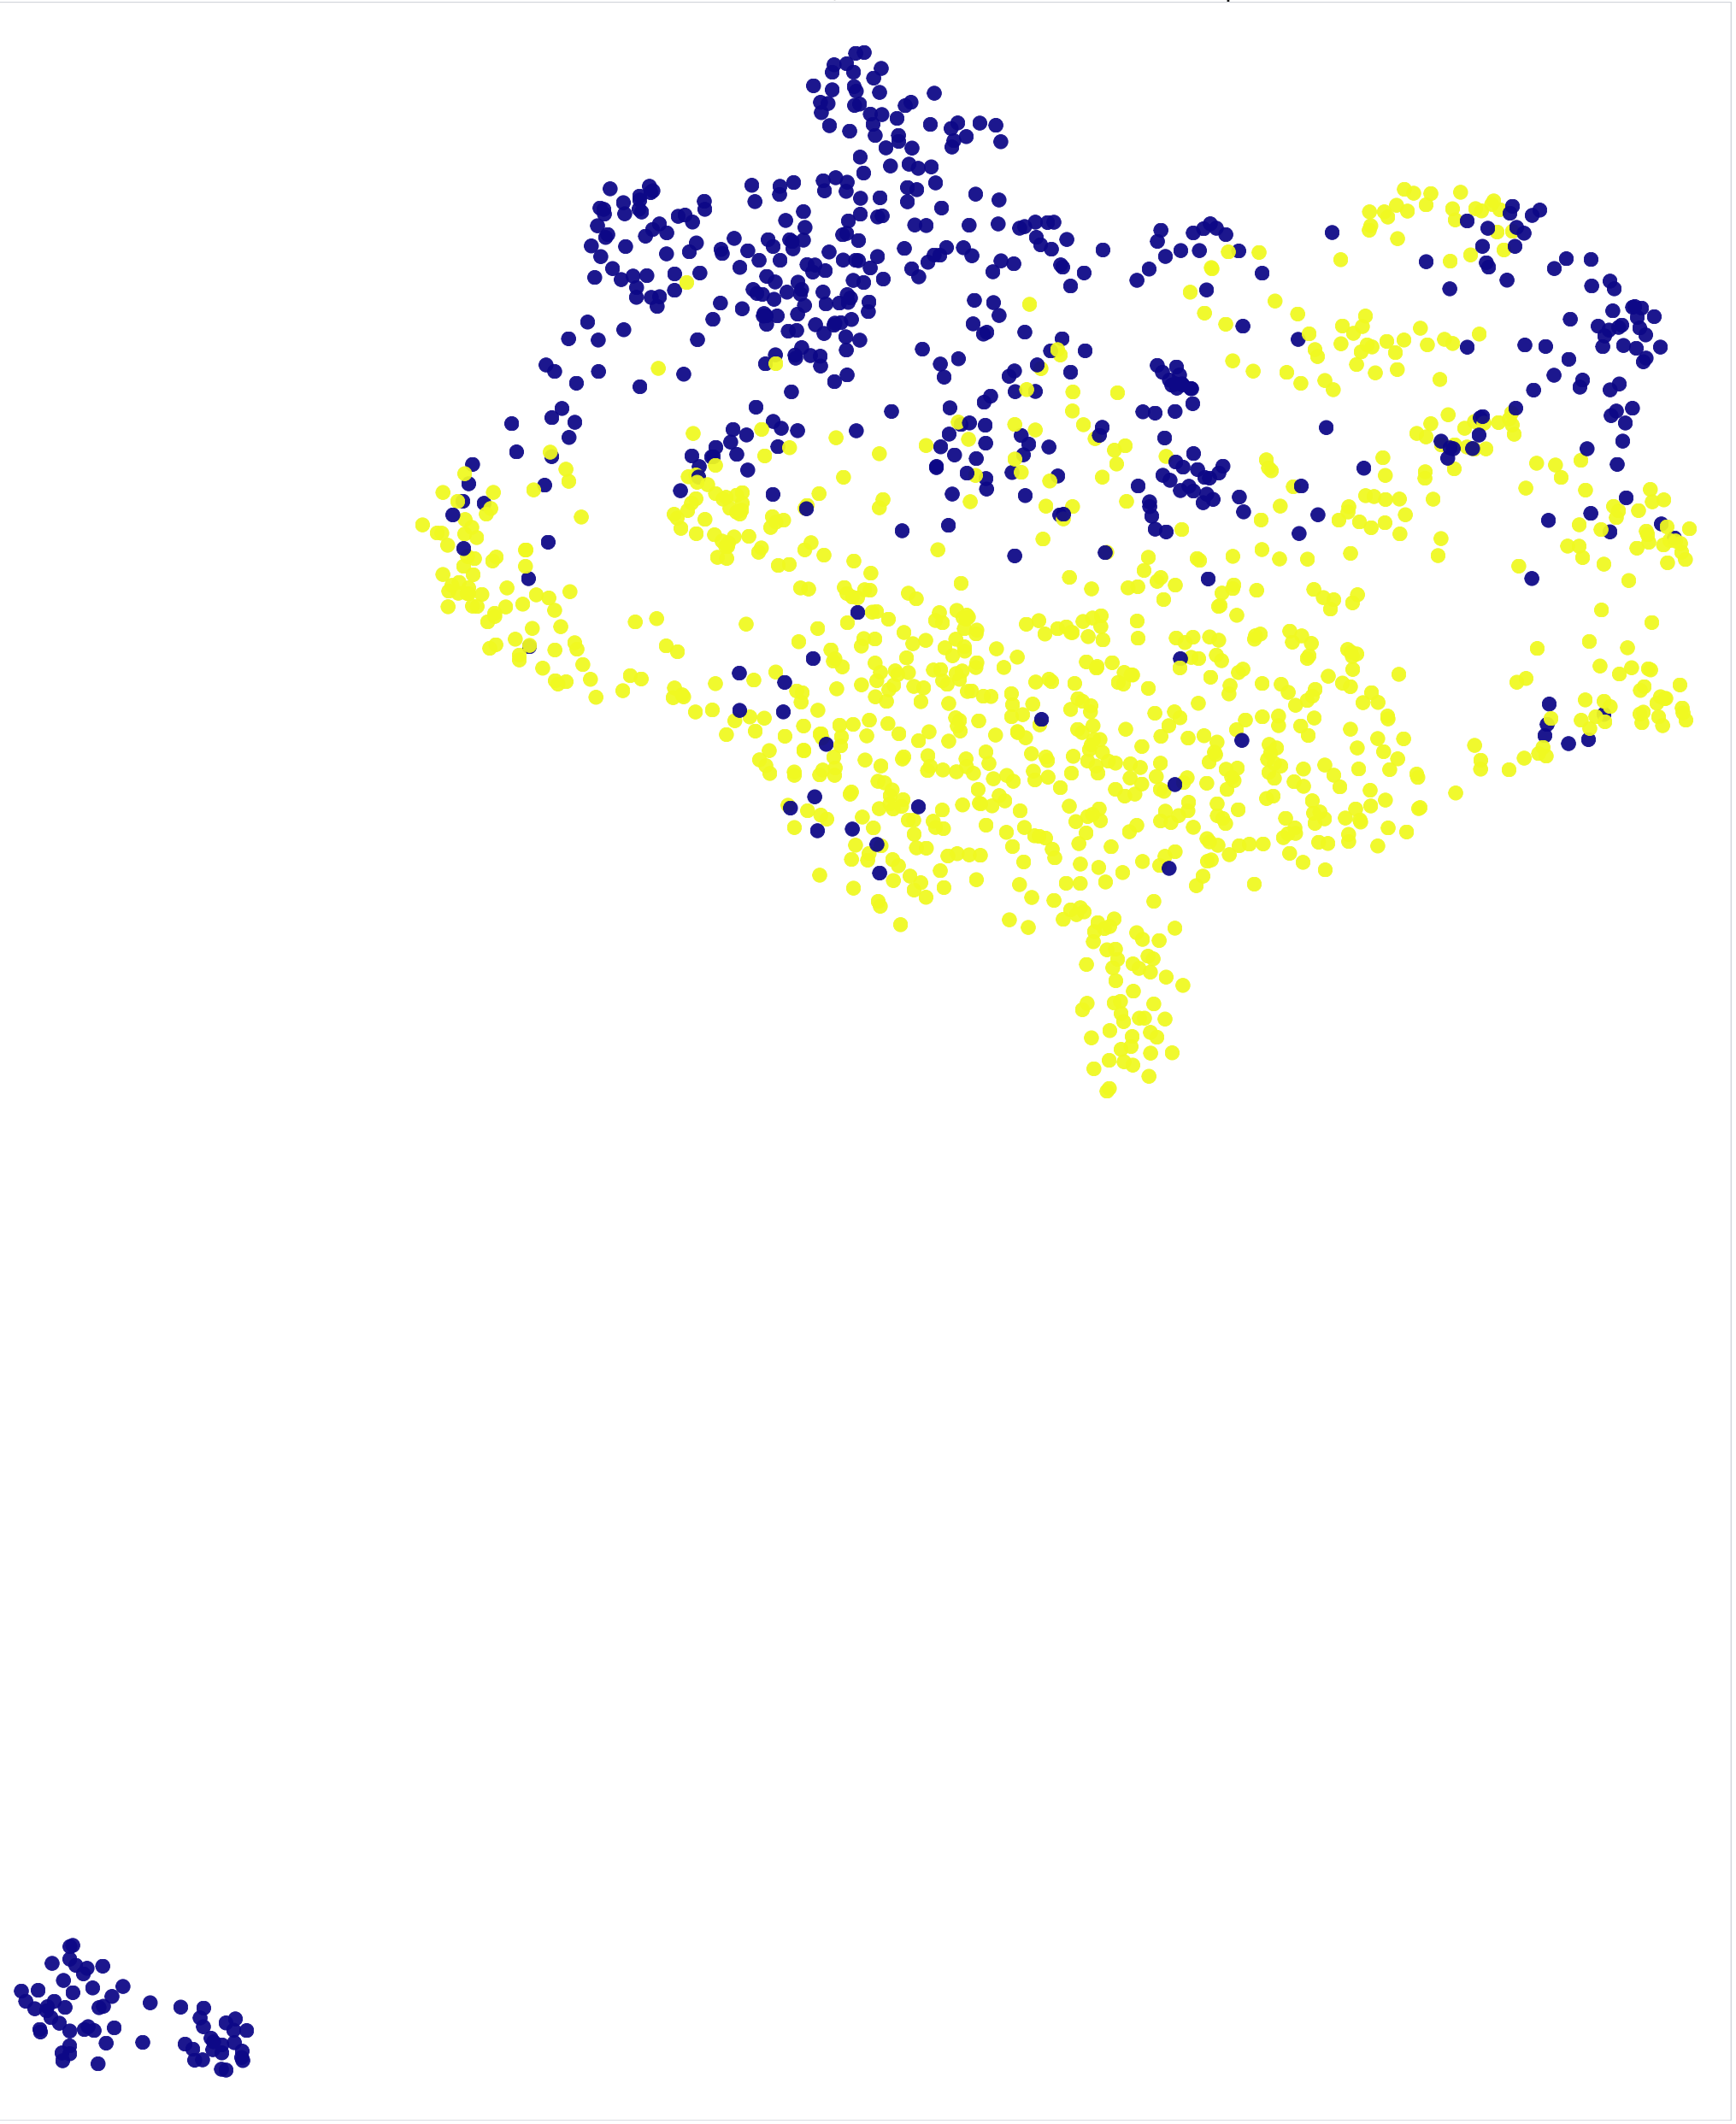

Goncalves adaptive–diffusion TBS tree by dominant fetal population

Whole tree; labels mark progenitor/endocrine nodes from the signature analysis

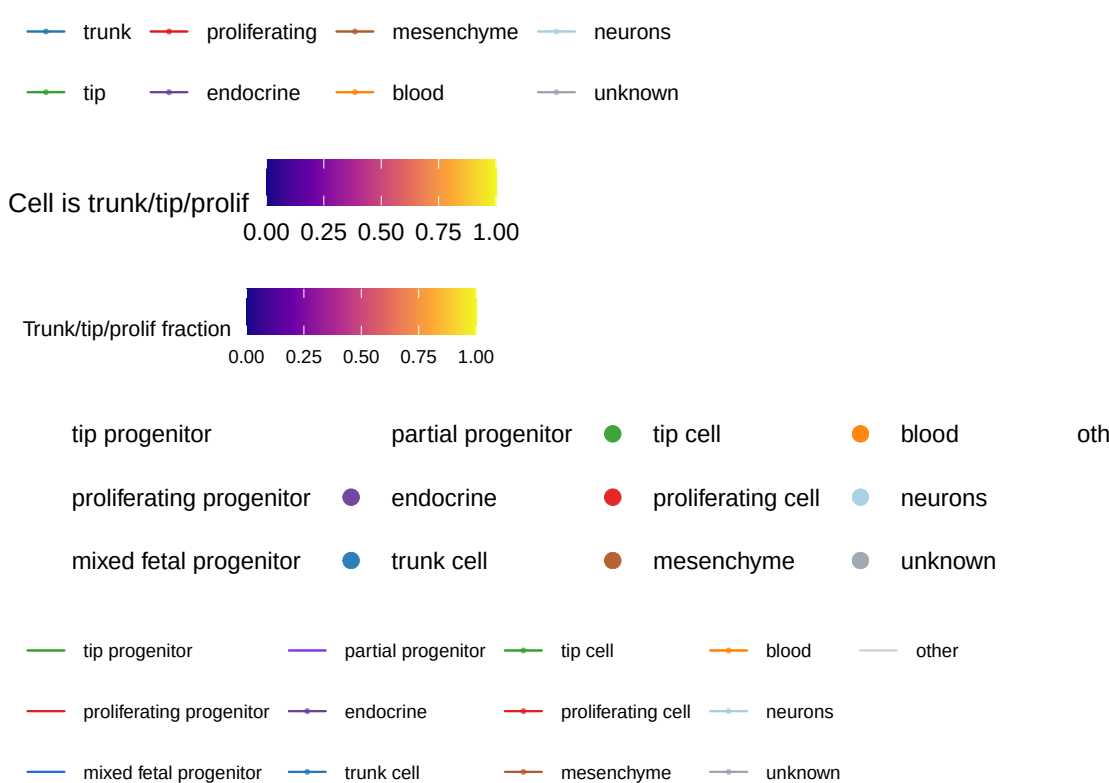

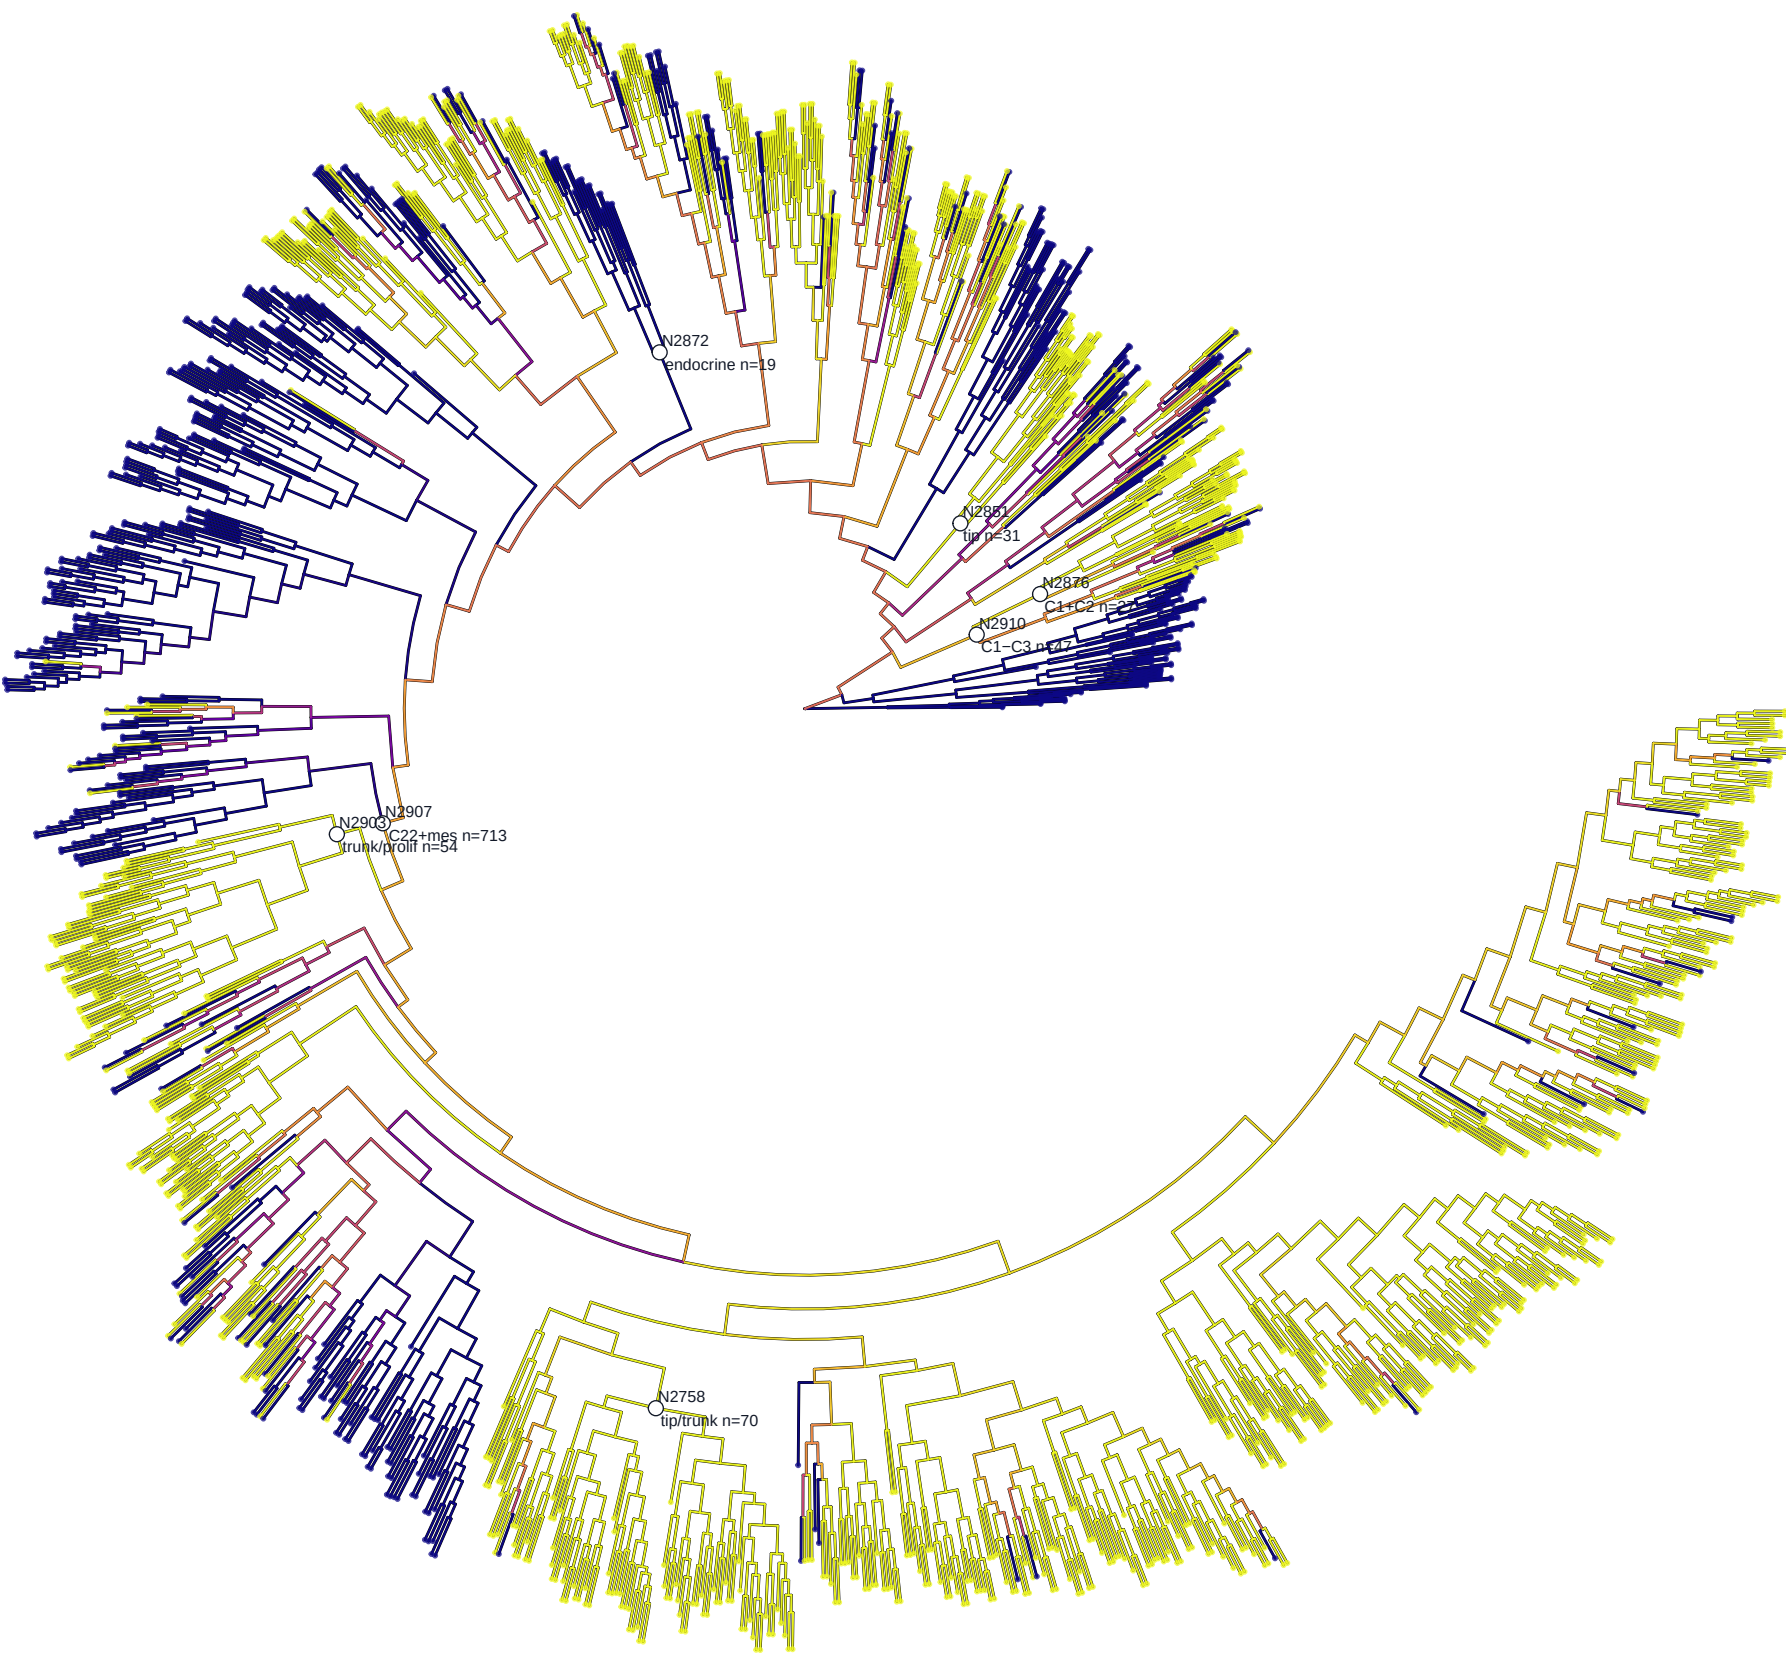

UMAP by progenitor–label membership

Tree color is descendant fraction; cell–level UMAP is 0/1 membership

Goncalves adaptive–diffusion TBS tree by progenitor fraction

Continuous color is fraction of descendant cells labeled trunk, tip, or proliferating

UMAP by progenitor interpretation

Terminal cells use population–derived state classes

Goncalves adaptive–diffusion TBS tree by progenitor interpretation

Internal branches use marker/population interpretation; terminal cells use their population label
